Heartbeat Data Analysis

Tools Used

Scipy, Numpy, Seaborn, Matplotlib, Sklearn, Pandas,

Data Import

I have used A00003.mat file for my analysis, it's a dictionary which have values for heartbeat from ECG. Data is described as

count	18000
mean	-
std	149.181
min	-1041
0.25	-36
0.5	20
0.75	57
max	520

Figure 1

Figure 2

In these graphs we can clearly see the outliers and bad values which be eliminated from the data sets.

First method: -
Smoothing technique

Figure 3

We can see the graph clearly the green line shows appropriate beat from the data.
So using Zscore and setting up threshold, we removed the outliers as shown in graph 1

Figure 4

Figure 5

Figure 6

In the graph we can clearly see that values greater than 500 is adjusted.
Now I have tried another method to clean up the data, using mean and value adjusting
us standard deviation.

Figure 7

Figure 8

Figure 9

Now after creating dataset from mean and Standard deviation values, I also applied K means clustering in new dataset.

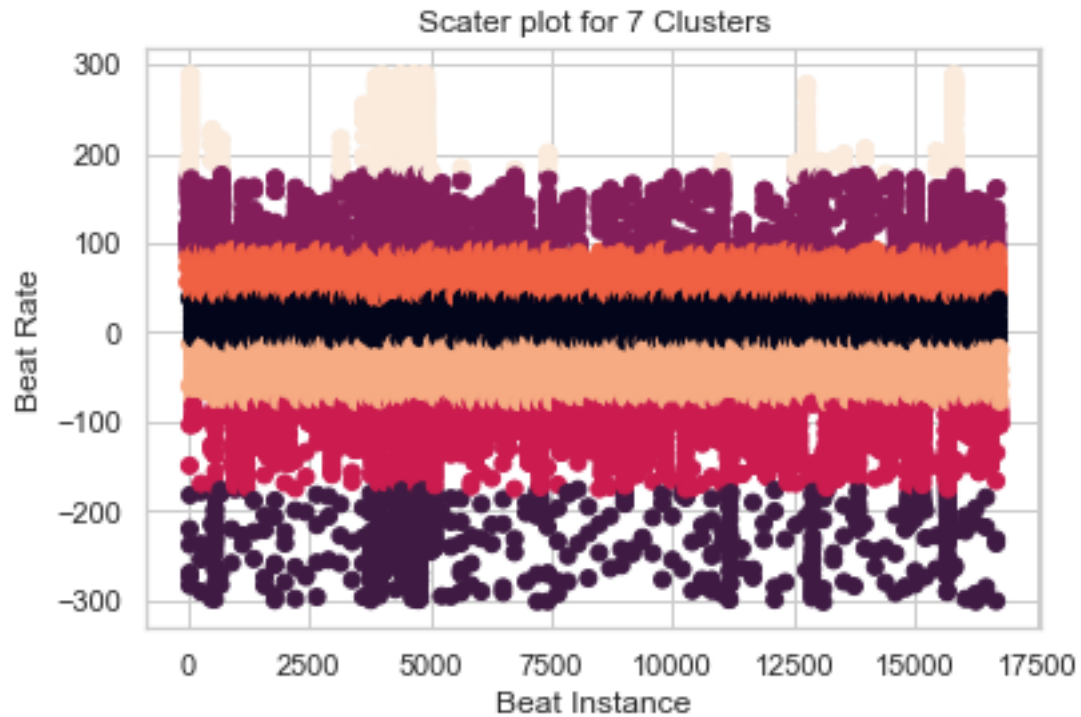

Figure 10

We also checked kmean clustering on original dataset.

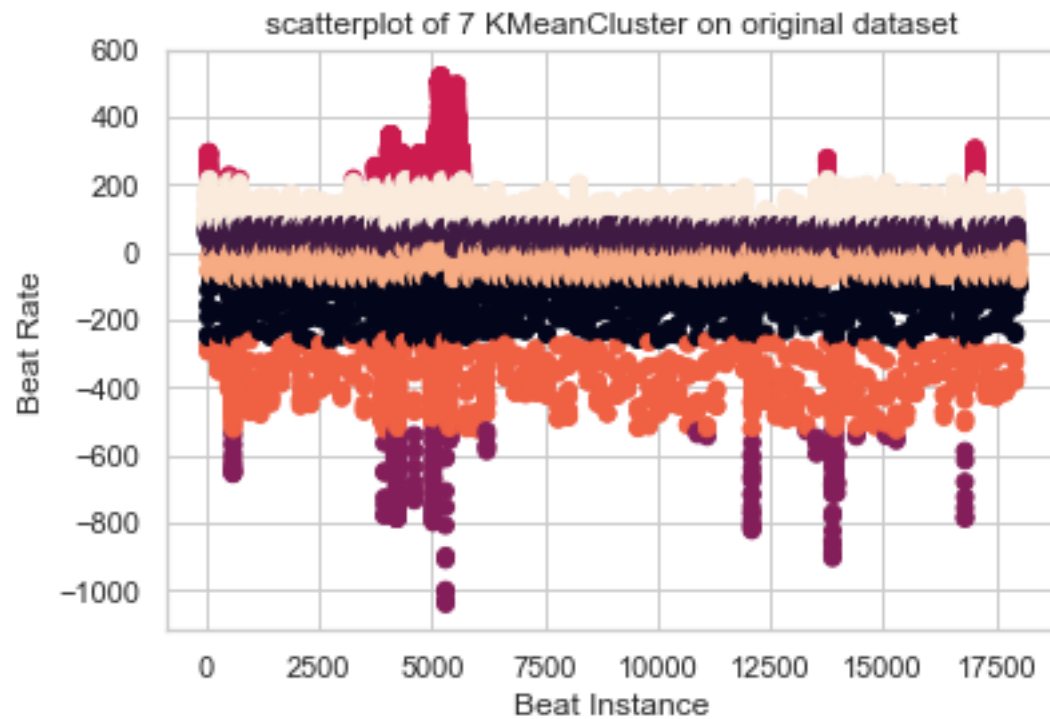

Figure 11

Finally, I have checked Nearest neighbor algorithm and Kmean clustering algorithm but it doesnt provide appropriate solution through it.
